# FDA approved therapy for Covid-19

### Remdesivir

- Anti-viral approved 10/2020
  - Prodrug adenosine analog inhibitor of viral RNA polymerase
- Effect: Shorter time to improvement, symptomatic improvement.
- Indication: Oxygen requirement (non-invasive ventilation).
- Not recommended: creatinine clearance <30 mL/min, renal replacement therapy.

# Repurposed drugs for Covid-19

### Dexamethasone

- Anti-inflammatory drug
- RECOVERY trial
  - Reduced mortality:
     Mechanical ventilation,
     oxygen support.

### Tocilizumab

- IL-6 inhibitor
- RECOVERY trial
  - Reduced mortality: Hypoxia (O<sub>2</sub><92%), including those on corticosteroids.

## **SARS-CoV-2** monoclonal antibodies

- Anti-viral mechanism
  - Bind spike protein block viral entry
- FDA EUAs for outpatient use
  - bamlanivimab/etesevimab (Lilly)
  - casirivimab/imdevimab (Regeneron)
- Efficacy
  - Reduce hospitalizations, severe disease
  - Especially in seronegative people
- Indications (adults)
  - SARS-CoV-2 positive
  - Symptoms ≤ 10 days
  - Not hospitalized
  - High risk for severe Covid-19
    - Body mass index (BMI) ≥35
    - CKD, immunocompromising condition, DM, ≥65
    - ≥55 with: Cardiovascular disease, *or* Hypertension, *or* COPD, *or* respiratory disease

| 39/M Kidney                        | Loss of smell, malaise<br>2 days           | N/A                 | 96%                 | BMI - 35                           | 14                  |

- 11 SOT recipients
  - 5 kidney, 1 kidney/liver
- Interventions
  - Stopped/lowered MMF (40%)
  - Lowered calcineurin inhibitor (70%)
- Outcome
  - None required hospitalization

### Benefits of CCP and monoclonal antibodies

### Convalescent plasma

- Ready made, readily available.
- Can be deployed rapidly.
- Might be only antiviral available in resource limited settings.
- Relatively inexpensive.
- Only immediately available agent for variants.
- Likely effective in immune deficiency.

### **Monoclonal antibodies**

- Require 'manufacture'.
- Take time to produce to scale, resources and cost (they are expensive) limit availability.
- Susceptible to viral escape, emergence of resistance.
- Potential for SQ administration.
- Smaller volume load, not blood product.

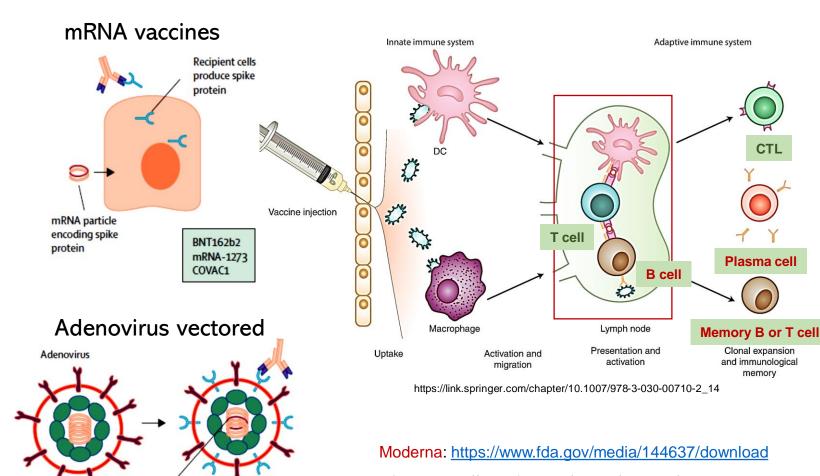

### **SARS-CoV-2 vaccines with FDA EUAs**

### mRNA

- Packaged in liposomes
- Spike protein mRNA
- Highly immunogenic
- Highly effective prevent severe disease and death
- Adenovirus vectored
  - Nonreplicating
  - Encode spike protein
  - Highly immunogenic
  - Highly effective prevent severe disease and death

```

- Retrospective EMR study of vaccine response
- 186 dialysis patients @ 32 clinics, 8 states
  - Median age 68 years; 47% women; 21% Black
  - 97.3% hemodialysis: 26% LTCF; 97% in-center hemodialysis
  - Responders: 165/186: 88%
  - Univariate non-responders: Female; shorter vintage (39 v 61 months); immunosuppressive therapy; receipt of another vaccine within 2 weeks; hospitalization within 14 days; CHF

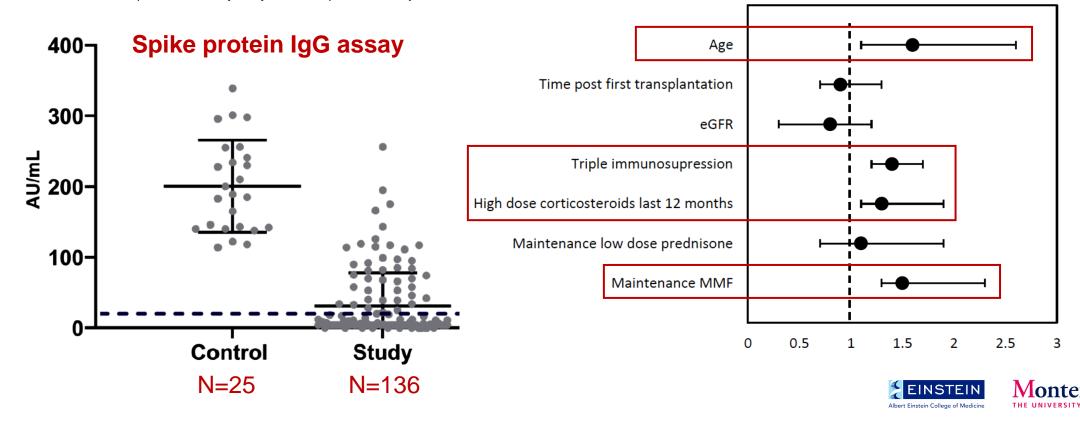

# Reduced humoral response to mRNA SARS-Cov-2 BNT162b2 vaccine in kidney transplant recipients without prior exposure to the virus.

# Covid-19 therapies and SARS-CoV-2 vaccines in patients with kidney disease

- Chronic kidney disease and dialysis
  - Vaccination is essential.
  - Outpatients with symptoms ≤10 days - Mab cocktail.
  - Inpatients: per protocols.
- Transplant
  - Current vaccines are likely to be poorly immunogenic.
  - Hopefully, prophylaxis with CCP or Mabs is on the horizon.
  - Inpatients: per protocols.

# Immediate/early Treatment with Mabs

Prevention with vaccine or prophylaxis

Virology, Transmission, and Pathogenesis of SARS-CoV-2 / BMJ 2020
